

Monetical Overview

For decades, organisations have invested in a growing range of software applications and solutions to manage the rising complexity of processes and resources. This investment has enabled them to retain existing levels of performance, but it has failed to bring significant improvements or an understanding of the factors truly affecting performance. Monetical is the first self-evaluation and optimisation solution that helps to solve this problem. Monetical focuses on helping small to medium sized businesses to take full control of continuous performance improvement through the analysis of project, infrastructure and enterprise activities to identify the required changes to these existing characteristics.

Overview

Through the capture, analysis and publication of a series of performance capability reports, Monetical enables your organisation to focus investment where it is most needed, as well as increasing the performance of day to day operational and commercial activities.

Transfer performance improvement ownership from external consultants to your organisation and:

- gain access to new specialist skills
- gain an outside perspective on issues
- share advice about performance factors

Monetical provides a series of on-demand tools, preconfigured collective intellect and collaboration capabilities that make self-evaluation and optimisation of your past, current and future performance a real opportunity.

Tailored Consulting Assignments

Curtail the growing complexity of your entire enterprise and enhance your overall performance capability with self-evaluation and optimisation using Monetical tailored consulting assignments.

Optimisation is reached through exploiting Monetical at three levels within your business and value chain.

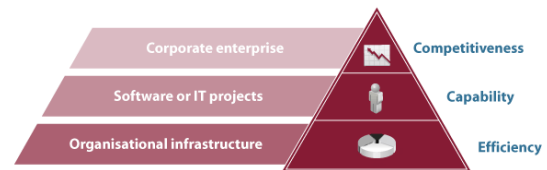

Figure 2 – Assignment tier

Enterprise Consulting Assignments blend the results of project and infrastructure assignments with an enterprise-wide assessment that uncovers the organisation's strengths and weaknesses in 10 key areas. This provides your organisation with an unrivalled view of how it can develop best-practices and exploit emerging techniques to reduce both operational and commercial challenges across the value chain.

Project Consulting Assignments help understand and optimise in real-time the performance of individual software solutions, services and IT projects. This type of assignments typically run for the same duration as the software or IT project they are supporting.

Infrastructure Consulting Assignments uncover both weaknesses and best practices within your organisation's standards, processes and applications. These types of assignment are typically run as a post-performance analysis exercise after the introduction of a key process or standard with the intention of measuring any influences on performance.
