

Project Consulting Assignments

Each Project Consulting Assignment provides project and department managers with an unrivalled opportunity to evaluate and optimise the performance of individual software and IT projects. Each assignment leverages the preconfigured collective intellect that is contained within a series of Monetical modules and collaboration capabilities to exploit the experience of others.

Overview

Since Project Consulting Assignments typically run for the same duration as the associated software or IT project, they provide invaluable support to project owners. By providing access to a suite of on-demand tools that capture, analyse and diagnose important performance factors, organisations are able to exploit historical project data to enhance current performance and better predict future project.

On-demand availability of the entire Project Consulting Assignment enables managers to extend the evaluation activities across the entire value chain, ensuring no critical operational or commercial characteristics are overlooked in the pursuit of performance optimisation.

Each Project Consulting Assignment consist of two stages:

- Project Evaluation Manager
- Project Optimisation Manager

Project Evaluation Manager

The key focus of the Project Evaluation Manager is to guide you through a complete reflective assessment of current and historical projects.

By analysing the characteristics and eventual performance of a large number of historical projects, Monetical helps you to identify fundamental strengths and weaknesses within your organisation's environment and the current active software or IT project. This real-time insight helps current project owners capture and diagnose true performance characteristics, which in turn improve decision-making and reduce risk. Senior Managers and Executives are better prepared to define strategic plans that will enable the organisation to reach and maintain an optimum level of performance.

Figure 1: Aligning with software and IT projects

Project Optimisation Manager

The Project Optimisation Manager is the second step in the real-time goal to improve performance of an active software or IT project.

Monetical provides real-time support to project owners at all stages in the project lifecycle, through its unique analysis capabilities. In contrast to traditional post-project retrospectives, where performance issues are identified for future project benefit, Monetical tracks performance in real-time, and provides reports which enable project owners to make incremental performance improvements. By helping you to maintain focus on key project objectives, whilst simultaneously limiting risk, Monetical minimises project variation and ensures all stakeholders are considered.

Throughout the project lifecycle Monetical ensures all the key decision-making characteristics, performance inferences and project make-up are retained within the Monetical knowledge repository. This continuous capturing ensures no experience is lost. Once held within the knowledge repository all future projects of a similar type benefit from the exploitation of best-practises and increased planning capabilities.

Both Managers are designed to synchronise with your current project management tools and software development methodologies.
